

# Models 422, 422A

## The "Balmoral"

### Radio Receivers

### Specifications

**Frequency Range:**

525 to 1750 K.C.

**I.F.:**

470 K.C.

**Tubes:**

Type	Function
6A8G	1st Detector and Oscillator
6J7G	2nd Detector
6K6G	Output
5Y4G	Rectifier

**Power Supply:**

Model 422: 105 to 125 volts A.C., 60 cycles

Model 422A: 105 to 125 volts A.C.,  
25-60 cycles.

**Controls:**

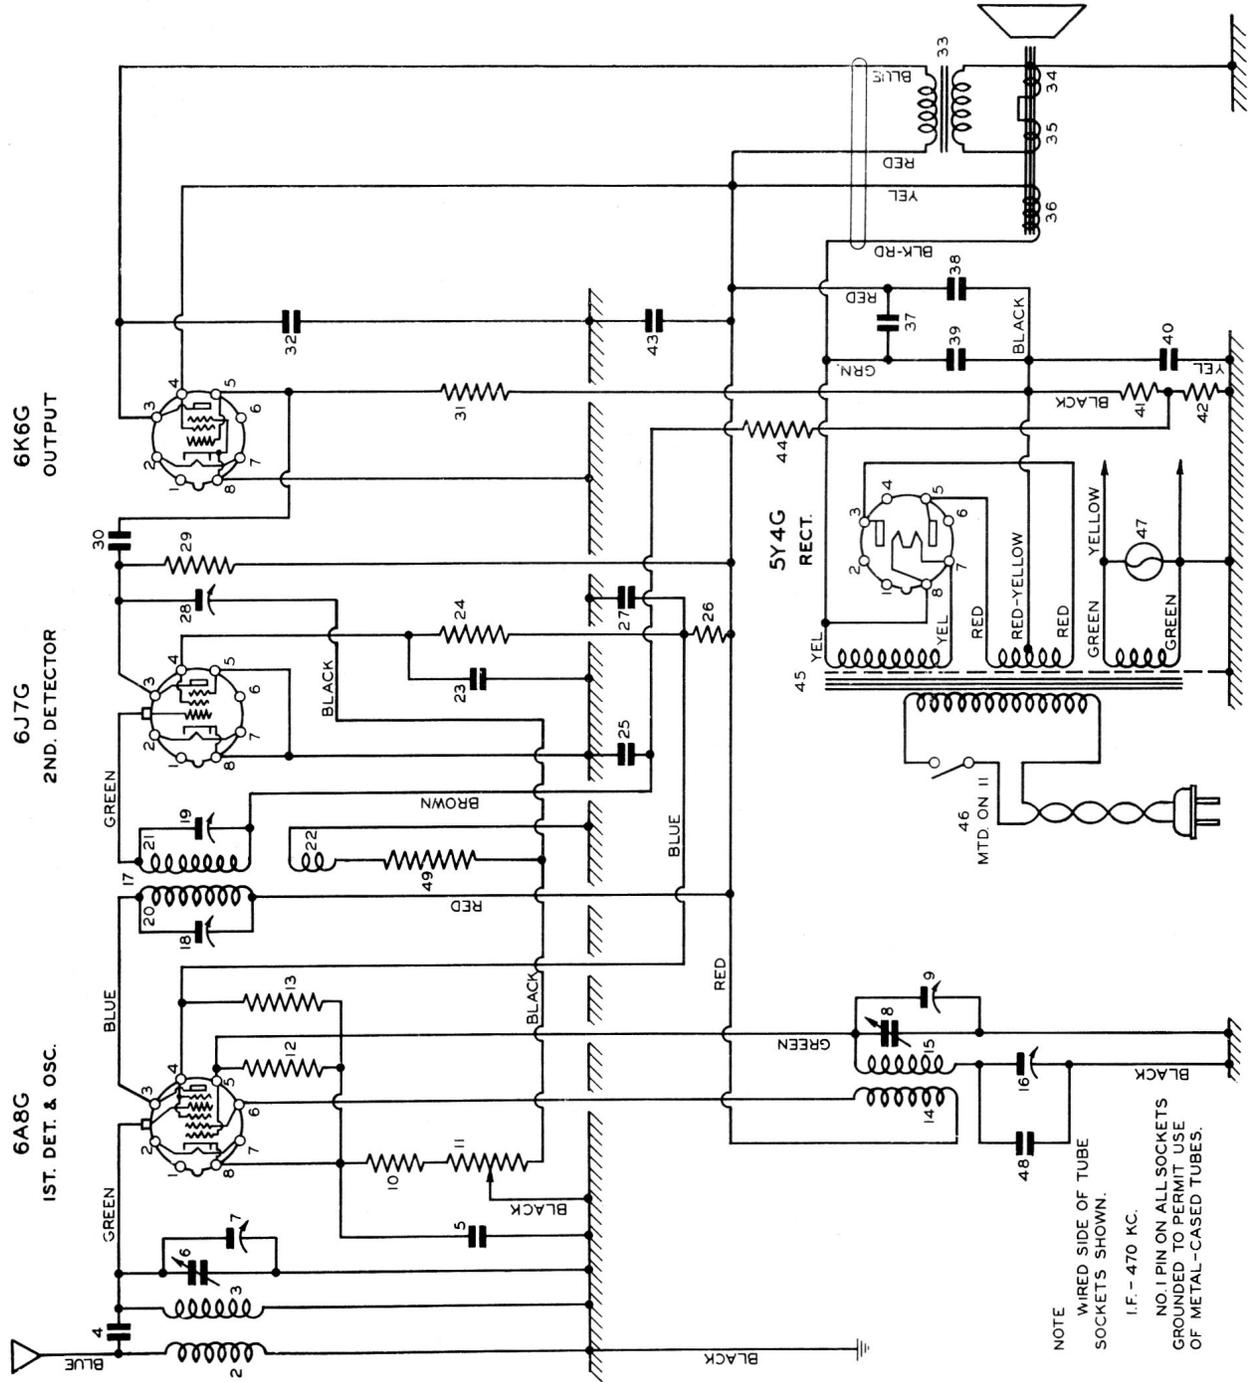

Upper—Tuning Control

Lower—A.C. Switch and Volume Control

**Cabinet:**

Mantel Model.

## REALIGNING INSTRUCTIONS

Model 422—Chassis Layout showing Aligning Positions.

### I.F. ALIGNMENT:

- (a) Set the signal generator at 470 k.c. and connect its output through an 0.1 mf. capacitor to the grid cap of the first detector (type 6A8G) tube. Set the receiver dial at about 600 k.c.
- (b) Sensitivity and selectivity depend greatly upon the regeneration control trimmer, item 28. The set should be allowed to operate and heat up for half an hour at least before attempting adjustments. If possible, the line voltage should be raised to 125 volts to make sure that trouble will not occur subsequently if the line voltage rises to such values. First unscrew trimmer, item 28, and then adjust trimmers, items 18 and 19, for maximum output.

## MODEL 422 RADIO RECEIVER

- (c) Screw in the regeneration control trimmer, item 28. The further this capacitance is increased the greater is the sensitivity. However, a limit is set by approach to a condition of instability and oscillation. Unless the line voltage is high, as noted above, the adjustment should be backed off from this optimum point to insure against instability developing later with the set in use.
- (d) Reduce the output from the signal generator to as low a value as will give an output reading, and check the adjustments of trimmers, items 18 and 19. Both should peak properly.

### R.F. ALIGNMENT:

- (a) With the gang all in, check the position of the

pointer. It should line up with the .52 me. calibration.

- (b) Couple the signal generator to the antenna lead through a 100 mmf. mica capacitor. Connect the ground lead (black) to ground.
- (c) Set the signal generator and the receiver at 1600 kilocycles. Adjust the trimmer, item 9, to bring in the signal.
- (d) Adjust trimmer, item 7, for maximum output.
- (e) Set the generator at 600 kilocycles, and tune the receiver to the signal. Adjust the lagging trimmer, item 16, for maximum output, while rocking the gang.

- (f) Recheck at 1600 kilocycles.
