

Model 630, 630A

Radio Receiver

Specifications

Frequency Range:

.535 to 1.72 megacycles

I.F.:

470 K.C.

Tubes:

Type	Function
6A8	Converter
6K7	I.F. Amplifier
6H6	2nd Detector, A.V.C.
6K5G	1st A.F. Amplifier
6F6G	Output Amplifier
5Y4G	Rectifier

Power Supply:

Model 630: 105 to 125 volts A.C., 60 cycles
Model 630A: 105 to 125 volts A.C., 25-60 cycles.

A.V.C.:

Full control applied to type 6A8, partial control applied to type 6K7.

Controls:

Left—Power switch and volume control.
Centre—Tuning control.
Right—Tone control.

Loudspeaker:

Six inch electrodynamic speaker.

Dial:

Edge lighted, vertical moving.

Cabinet:

Table model.

REALIGNING INSTRUCTIONS

To secure full advantage of the performance characteristics of this receiver, any realignment necessary should be carried out carefully. A reliable test oscillator or signal generator and also an output meter should be employed.

I.F. ALIGNMENT:

- (a) Set the signal generator to 470 kilocycles. Connect its output through a 0.1 mf. capacitor to the grid cap of the first detector, type 6A8, and set the receiver dial to about 600 kilocycles.
- (b) Adjust trimmers 20, 21, 25 and 26 for maximum output.
- (c) Reduce the output from the generator to as low a value as will give an output reading and check the adjustments. All trimmers should peak properly.

R.F. ALIGNMENT:

- (a) With the gang all in, check the position of the pointer. The upper edge of it should line up with the end of the calibration line. The pointer can be easily adjusted by loosening the set-screws on the large pulley.
- (b) Couple the signal generator to the antenna (blue) lead through a 100 mmf. mica capacitor. Connect the ground (black) lead to ground.
- (c) Set the generator and receiver to 1600 kilocycles. Adjust trimmer, item 10, to bring in the signal, and then adjust trimmer, item 6, for maximum sensitivity.
- (d) Set the generator and receiver to 600 kilocycles. Adjust trimmer, item 14, to bring in the signal. Adjust the iron core, item 1, for maximum sensitivity.
- (e) Recheck at 1600 kc. and readjust if necessary.

SOCKET VOLTAGE READINGS

These readings were taken with the gang capacitor all in, and line voltage of 115 volts. Voltage readings can be duplicated using any good voltmeter having a resistance of 1000 ohms per volt, such as the Weston Model 663 Volt-Ohmmeter or the Weston Model 772 having a resistance of 20,000 ohms per volt. Current readings can be duplicated with the Weston Model 556 Analyzer and a Model 666-1A Socket Selector. When taking readings with the selector attachment, connect a 0.1 mf. capacitor from the grid of the tube in the selector to the chassis, to prevent oscillation.

These readings were taken with the power off.

* Measured to Pin No. 8 of type 5Y4G rectifier tube.

† This measurement was made from the high side of the volume control, item 40. Note that an ohmmeter should not be connected from the type 6K5G control grid to ground since the reading would be erroneous due to the bias cell voltage and since the resultant load on the bias cell would damage it at least temporarily.

Heater readings were obtained without tubes in sockets.
