

Models 832, 833, 633, 832A, 833A, 633A

Specifications

Frequency Range:

Broadcast—.537 to 1.715 megacycles.
Shortwave—5.7 to 15.6 megacycles.

I.F.:

470 K.C.

Tubes:

Type	Function
6A8	1st Detector
6J5	Oscillator
6K7	I.F. Amplifier
6H6	2nd Detector, A.V.C.
6K5G	1st A.F. Amplifier
6F6G	Output Amplifier
6U5	Tuning Indicator
5Y4G	Rectifier

Models 633, 633A, the 6U5 tuning indicator is omitted, and a type 6Q7G is used in place of the 6H6.

Power Supply:

Models 833, 832, 633: 105 to 125 volts A.C., 60 cycles.

Models 833A, 832A, 633A: 105 to 125 volts A.C., 25-60 cycles.

A.V.C.:

Applied to types 6A8 and 6K7, also 6U5 tuning indicator.

Controls:

Left to Right: Volume control; A.C. switch and tone control; wave change switch; tuning control.

Loudspeakers:

Models 832, 832A—Six inch electrodynamic.
Models 833, 833A—Eight inch electrodynamic enclosed in a tone chamber.

Models 633, 633A—Eight inch electrodynamic.

Cabinets:

Models 832, 832A—Table models.
Models 833, 833A—Console models.
Models 633, 633A—Console models.

GENERAL:—The Models 832 and 833 are eight tube a-c operated superheterodyne radio receivers. The Model 832 is mounted in a table cabinet and uses a six-inch electrodynamic loudspeaker. The Model 833, mounted in a console cabinet, uses an eight-inch electrodynamic loudspeaker and is equipped with a tone chamber. The Model 633 is a six-tube superheterodyne receiver, mounted in a console cabinet and using an eight-inch loudspeaker. It is very similar to the Model 833, the chief differences being that a different cabinet, without a tone chamber is used, the type 6U5 tuning indicator is omitted, and a type 6Q7G radiotron is used in place of the types 6H6 and 6K5G used in the larger receivers.

The dials are of the horizontal rectangular type, and are of edge-lighted etched glass. All calibrations are in megacycles. The band on which the receiver is operating is indicated by illumination of the windows beneath the calibrations on the Models 832 and 833 and by means of the pointer underneath the wavechange knob and a decalcomania label on the Model 633.

The tuning ranges are:—

Broadcast Band—.537 to 1.715 megacycles.

Short Wave Band—5.7 to 15.6 megacycles.

The a-c load rating at 115 volts line for the Models 832 and 833 is 59 watts for the 60 cycle models and 62 watts for the 25 cycle models. The Model 633 requires 54 watts on 60 cycles and 57 watts on 25 cycles. Models 832, 833 and 633 are for use on 60 cycle supplies and Models 832A, 833A and 633A on supplies from 25 to 60 cycles.

CIRCUIT:—Models 832 and 833 (Refer to Fig. 6—Schematic Circuit Diagram)—The iron-cored broadcast antenna transformer uses both inductive coupling between the primary and secondary, items 1 and 2, and capacity coupling through item 4. The broadcast and short-wave

antenna transformer primaries are connected in series from the antenna to ground, short wave signals being bypassed around the broadcast primary by the capacitor, item 5. Item 8 switches the antenna transformer secondary while item 25 performs the same function for the oscillator plate windings, items 15 and 18. The gang capacitor consists of two sections, items 10 and 20. The broadcast oscillator coil, item 18, consists of a single winding and obtains its feed-back from the voltage across the lag capacitor, item 19. The type 6J5 oscillator uses plate tuning which makes for greater stability on the short-wave band. Oscillator voltage from the grid of the oscillator is injected into the type 6A8 first detector, by direct coupling with its oscillator grid. The intermediate frequency is selected by the double tuned I.F. amplifier, item 31, and amplified by the type 6K7 I.F. amplifier. This tube is in turn coupled to the type 6H6 second detector by a second double tuned I.F. transformer, item 39. The signal developed across diode load resistor is fed to the type 6K5G first audio amplifier through the coupling capacitor, item 53, and volume control, item 54. The type 6K5G is in turn resistance capacitance coupled to the type 6F6G output amplifier through the tone control which consists of items 60 and 61. The output and power supply circuits are conventional. Bias voltage is obtained across resistors, items 71 and 72, and from the bias cell, item 55. Full automatic volume control is applied to both the type 6A8 and type 6K7 through the filter, items 48 and 27. The type 6U5 tuning indicator is also operated by a.v.c. voltage. When the receiver is tuned to a signal, the rise in a.v.c. voltage decreases the current through the resistor, item 49. This causes the plate voltage to rise which results in the illuminated segment of the indicator reaching a maximum.

MODELS 832, 833 AND 633 RADIO RECEIVERS

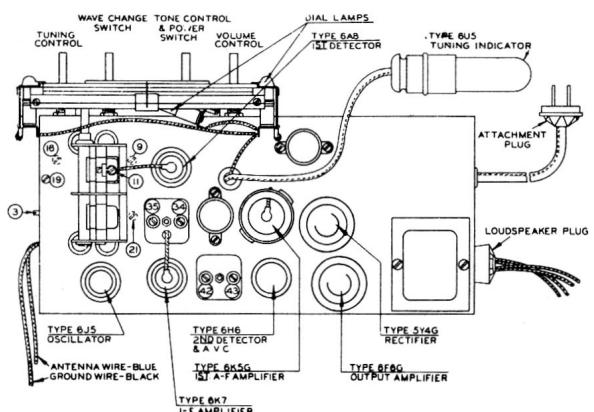

Fig. 1.—Chassis Layout Showing Controls and Tube Locations—Model 832.

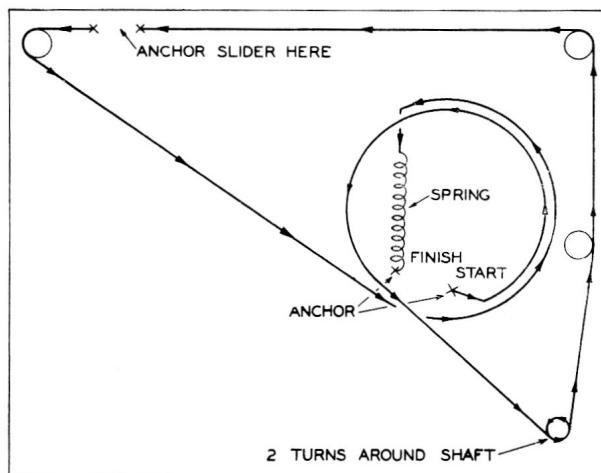

Fig. 4.—Stringing Diagram—Model 832.

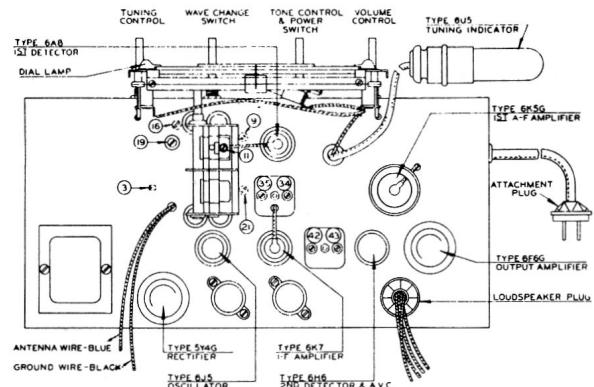

Fig. 2.—Chassis Layout Showing Controls and Tube Locations—Model 833.

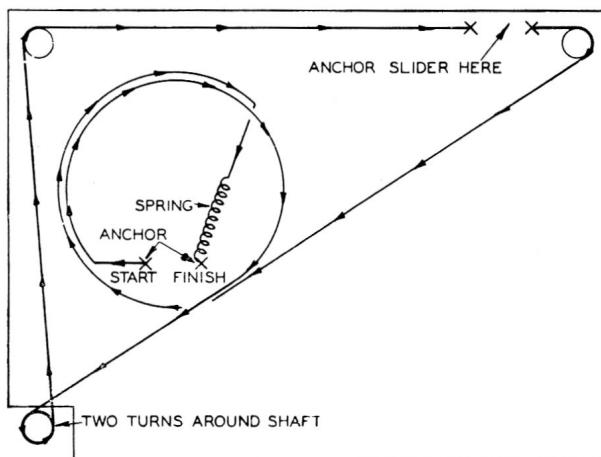

Fig. 5.—Stringing Diagram—Models 833 and 633.

Model 633 (Refer to Fig. 7—Schematic Circuit Diagram).—Examination of the circuit of the Model 633 will reveal that it is identical with that of the Models 832 and 833 apart from the facts that the type 6U5 tuning indicator is omitted and the type 6Q7G diode detector and triode amplifier combines the functions of the types 6H6 and 6K5G.

^① These measurements were made to pin No. 8 of the type 5Y4G rectifier.

^② This reading was taken from the high end of the volume control, item 54, to ground. Note that it is most important to avoid connecting an ohmmeter to the top cap of the type 6K5G, since the reading would be erroneous due to the bias cell voltage and since the resultant load on the bias cell might damage it seriously.

REALIGNING INSTRUCTIONS

To secure full advantage of the performance characteristics of these receivers, any realignment necessary should be carried out carefully. A reliable test oscillator or signal generator and also an output meter should be employed. A signal generator utilizing harmonics to cover the short wave band should not be used.

I.F. ALIGNMENT:

- (a) Set the signal generator to 470 kc. and connect its output through a 0.1 mf. capacitor to the grid cap of the first detector (type 6A8 tube). Set the receiver dial to about 600 kc. and turn the wave change switch to the broadcast position.
- (b) Adjust trimmers, items 34, 35, 42 and 43 for maximum output.
- (c) Reduce the output from the generator to as low a value as will give an output reading and check the adjustments. All trimmers should peak properly.

R.F. ALIGNMENT—Broadcast Band:

- (a) With the gang all in, check the position of the pointer. It should line up with the end of the

calibration line. Put the wave change switch in the broadcast position.

- (b) Couple the signal generator to the antenna (blue) lead through a 100 mmf. mica capacitor. Connect the ground (black) lead to ground.
- (c) Set the generator and receiver to 600 kc. Adjust trimmer, item 19, to tune in the signal. Adjust the iron core of the antenna coil, item 3, for maximum sensitivity.
- (d) Set the generator receiver to 1600 kc. Adjust trimmer, item 21, to bring in the signal and then adjust trimmer, item 11, for maximum sensitivity.
- (e) Recheck at 600 kc. and repeat if necessary.

R.F. ALIGNMENT—Short Wave Band:

- (a) Substitute a 400 ohm carbon resistor for the capacitor in the lead from the signal generator. Turn the wave change switch to the short-wave position.
- (b) Set the generator and receiver to 15 mc. Adjust trimmer, item 16, to bring in the signal. Then adjust trimmer, item 9, for maximum sensitivity while rocking the gang. Check for image at 15.9 mc.

Description	Resistance
Loudspeaker H.B. Coil07
Loudspeaker Voice Coil (impedance 1.8 ohms at 400 cycles)	1.3
Loudspeaker H.B. Coil1
Loudspeaker Voice Coil (impedance 1.82 ohms at 400 cycles)	1.8
Power Transformer, Primary (60 cycles)	8.9
Power Transformer, Primary (25 cycles)	12.3
Power Transformer, H.V. Sec. (60 cycles)	50.0
Power Transformer, H.V. Sec. (25 cycles)	72.6
Power Transformer Heaters (60 cycles)14
Power Transformer Heaters (25 cycles)19
Power Transformer Rectifier (60 cycles)19
Power Transformer Rectifier (25 cycles)23

SOCKET VOLTAGE READINGS — MODELS 832 AND 833

These readings were taken with the gang capacitor all in, wave-change switch on the broadcast band and line voltage of 115 volts. They can be duplicated with any good volt-ohmmeter such as the Weston Model 663 or the Weston Model 772 and a Weston Model 666 socket selector. When taking readings with the selector attachment, connect a 0.1 mf. capacitor from the grid of the tube in the selector to the chassis, to prevent oscillation.

TUBES	VOLTAGES					CURRENTS—M.A.		
	Heater A-C	Plate	Screen	Grid	Cathode	Screen	PLATE	
							Normal Bias	Bias red. $4\frac{1}{2}$ V.
Type 6A8 1st Detector	6.3	165	75	—2.8 ①	0	3.25	4.6	7.4
Type 6J5 Oscillator	6.3	65	—	0	0	—	5.5	6.1
Type 6K7 I.F. Amplifier	6.3	175	85	—2.8 ①	0	1.7	7.2	7.5
Type 6H6 Second Detector & A.V.C.	6.3	—	—	—	—2.8 ①	—	—	—
Type 6K5G 1st A.F. Amplifier	6.3	70	—	— ③	—2.8 ①	—	0.4	0.7
Type 6F6G Output Amplifier	6.3	165	175	—12.0 ②	—2.8 ①	4.0	24.5	29
Type 6U5 Tuning Indicator	6.3	35	175 (Target)	—	—2.8 ①	1.4 (Target)	.17	—
Type 5Y4G Rectifier	5.0	—	—	—	308	—	Plate No. 1 24.0	Plate No. 2 27

① Measured across resistor, Item 72.

② Measured across resistors, Items 71 and 72.

③ Do not attempt to measure this voltage with a voltmeter since the resultant load on the bias cell might seriously damage it.

SOCKET VOLTAGE READINGS — MODEL 633

TUBE	VOLTAGES					CURRENTS—M.A.		
	Heater A-C	Plate	Screen	Grid	Cathode	Screen	PLATE	
							Normal Bias	Bias red. $4\frac{1}{2}$ V.
Type 6A8 1st Detector	6.3	165	75	—2.8 ①	0	3.25	4.6	7.4
Type 6J5 Oscillator	6.3	65	—	0	0	—	5.5	6.1
Type 6K7 I.F. Amplifier	6.3	175	85	—2.8 ①	0	1.7	7.2	7.5
Type 6Q7G 2nd Detector & A.V.C.	6.3	70	—	— ③	—2.8 ①	—	0.4	0.7
Type 6F6G Output Amplifier	6.3	165	175	—12.0 ②	—2.8 ①	4.0	24.5	29
Type 5Y4G Rectifier	5.0	—	—	—	308	—	Plate No. 1 24.0	Plate No. 2 27

① Measured across resistor, item 69.

② Measured across resistors, items 68 and 69.

③ Do not attempt to measure this voltage with a voltmeter since the resultant load in the bias cell might seriously damage it.
