ALIGNING COMPENSATORS MODELS 46, 46L

EQUIPMENT: To accurately adjust these receivers, an accurately calibrated signal generator such as the Philco Model 177 is required. Maximum signal strength is shown by the use of a vacuum tube voltmeter and circuit tester such as the Philco Model 028. The vacuum tube voltmeter is connected in the circuit by using an aligning adapter, Philco Part No. 45-2767. The output indicator is connected as follows: Remove the 7C6 detector tube from the socket, insert the aligning adapter in the tube socket, insert the tube in the top of the adapter, connect the light-coloured wire which protrudes from the side of adapter to negative (-) terminal of vacuum tube voltmeter. Attach positive (+) terminal of voltmeter to the black wire.

A fibre handle screwdriver, Philco Part No. 45-2610 and fibre wrench, Philco Part No. 3164 are the necessary aligning tools.

LOCATION OF COMPENSATORS

Operations in Order	SIGNAL GENERATOR		RECEIVER			REMARKS
	OUTPUT CONNECTIONS	Dial Frequency	Dial Frequency	Control Settings	ADJUST COMPENSATORS FOR MAXIMUM SIGNAL	
1	High Side to Antenna Section of Gang	460 K.C.	580 K.C.	Volume Max.	12B, 12A, 10B, 10A	Note "A"
2	High Side to Antenna Lead	1500 K.C.	1500 K.C.	Volume Max.	4B, 4A	Note "B and C"
3	High Side to Antenna Lead	1000 K.C.	1000 K.C.	Volume Max.		Check Calibration
4	High Side to Antenna Lead	600 K.C.	600 K.C.	Volume Max.		Check Calibration

Note A: A dummy antenna consisting of a .1 mfd. condenser is connected in series with the high side of the signal generator output lead. This dummy is used for I.F. alignment only.

Note B: A dummy antenna for aligning the R.F. circuits consists of a 100 Mmfd. condenser in series with the high side of the signal generator output lead.

Note C: The dial must be aligned to track properly with the tuning condenser. This is accomplished by closing the tuning condenser (maximum capacity) and setting the pointer on the extreme left index dot at the low frequency (550 K.C.) end of the broadcast scale.
