Depth

13 $\frac{1}{2}$ inches

General Description

The Model VR-245 is a table Phonograph Radio Combination, employing a five-tube, four band superheterodyne circuit, the arrangement of which is shown in the Schematic Circuit Diagram.

Features of the Design include, loop antenna as the first tuned circuit; three Spread Bands; Magnetite core oscillator coils; Temperature stabilized capacitors in

the Oscillator circuit resulting in less frequency drift; Magnetite Core; I. F. Transformers; Automatic two position Tone Control circuit; Dust-proof electrodynamic loudspeaker; and a large edge lighted dial individually calibrated for each band.

Features of the Phonograph include a new light weight crystal Pickup; a rim drive constant speed Motor, with automatic Stop Start Switch.

Circuit Arrangement

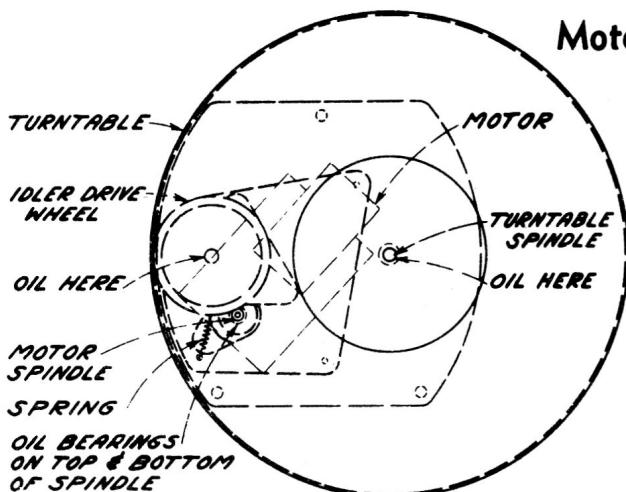

The circuit consists of a first detector (oscillator) stage incorporating the Loop Antenna as the first tuned circuit; I.F. amplifier stage; second detector, A.V.C. and first Audio stage; single pentode output operating in Class A-B; and a well regulated power supply.

The Loop Antenna used in the first tuned stage is in the circuit on the "A" band; temperature compensated capacitors are used in the oscillator circuits to reduce

oscillator drift.

The intermediate frequency amplifier consists of a Type 6SK7 tube in a single stage transformer-coupled circuit. The windings of both I.F. Transformers are resonated by magnetite cores and are adjusted by adjustable capacitors to tune to 455 K.C.

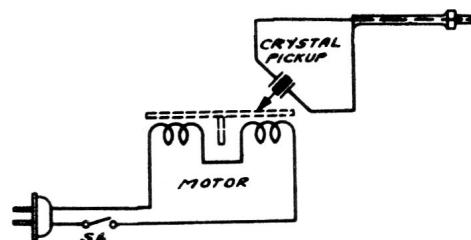

The Audio circuit is a conventional resistance-coupled stage.

Motor Top View

Phonograph Motor Service Data:

The phonograph motor is of the self starting synchronous type and operates the turntable through friction drive between the motor drive spindle and the rubber tired idler on the rim of the turntable.

Motor & Pickup Circuit

The motor should be lubricated once or twice a year by placing a few drops of S. A. E. 20 (or equivalent) on the turntable spindle and saturating the oil retaining felt pads on the motor shaft with S. A. E. 10 oil. Caution—The motor drive spindle and the rubber tire on the idler must be kept clean and entirely free from oil and grease at all times.

Service Data—Crystal Pickup

The Crystal Pickup unit is thoroughly sealed in a metal casing, against extreme changes of climate. The off-set pickup arm ensures ideal tracking of Needle in the Record grooves. If failure occurs due to a defective crystal, no attempt should be made to repair the unit,

but a new replacement crystal cartridge should be installed. To replace Crystal:— Remove two fillister head screws, lift crystal cartridge from arm, remove female cable plug from the Crystal. The arm uses a removable type needle.

RADIOTRON SOCKET VOLTAGES

| Type | Plate | Screen Grid | Control Grid | Cathode | Heater |
|----------------|---|-------------|--------------|-----------|--------|
| 6SA7 Conv. | 270V | 100V | | | 6.4V |
| 6SK7 I.F. | 275V | 100V | | | 6.4V |
| 6SQ7 Audio | 80V | | | | 6.4V |
| 6F6G Output | 250V | 260V | | 16V | 6.4V |
| 5Y4G Rectifier | Transformer A.C. output measured from each plate to chassis | | | 345V A.C. | 5.0V |

Note:—All the above values hold within plus or minus 20% when measured with a 20,000 ohm-per-volt meter, on a line voltage of 115 volts. All voltages are measured to chassis.

Alignment Procedure

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph should be made to the chassis and the green lead on the volume control.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the output as low as possible to avoid a-v-c action.

Calibration Scale on Indicator-Drive-Cord-Drum.—The tuning dial is fastened in the cabinet and cannot be used for reference during alignment; therefore, a calibration scale is attached to the tuning drum. The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

As the first step in r-f alignment, check the position of the drum. The 180° mark on the drum scale must be vertical and directly above the center of the shaft of the tuning drum when the plates are fully meshed. The drum is held to the shaft by means of two set-screws, which must be tightened securely when the drum is in the correct position.

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by fastening a piece of wire to the condenser gang, and bend the wire so that it points to the 180° mark on the calibration scale when the plates are fully meshed.

Spread-Band Alignment.—The most satisfactory method of aligning or checking the spread-band ranges is on actual reception

of short-wave stations of known frequency, by adjusting the magnetite-core oscillator coil for each band so that these stations come in at the correct points on the dial.

In exceptional cases, when the set is being serviced in a location where the noise level is high enough to prevent reception of short-wave stations, a test-oscillator may be used for alignment, but an extremely high degree of accuracy is required in the frequency settings of the test-oscillator, as a slight error will produce considerable inaccuracy on the spread-band scales. The frequency settings of the test-oscillator may be checked by one or both of the following methods:

1. Determine the exact dial settings of the test-oscillator (for frequencies at or close to the specified alignment frequencies) by zero-bearing the test-oscillator against short-wave stations of known frequency.
2. Use harmonics of the standard-broadcast range of a test-oscillator, first checking the frequency settings on this range by means of a crystal calibrator (RCA Stock No. 9572), or by zero-beating against standard broadcast stations.

When a test oscillator is employed for spread-band alignment, a final check should be made on actual reception of short-wave stations of known frequency, and the magnetite-core oscillator coil for each band should be re-adjusted so that the stations come in at the correct points on the dial.

NOTE:—Whenever possible spread band final adjustments should be made with the chassis fastened in the cabinet and the pointer accurately aligned to the dial.

| Order of Alignment | Test Oscillator | | | Range Selector | Receiver Dial Setting | Circuit to Adjust | Adjustment Symbols |
|--------------------|------------------------|---------------|-------------------|----------------|------------------------|----------------------|--------------------|
| | Connection to Receiver | Dummy Antenna | Frequency Setting | | | | |
| 1 | Control Grid 6SK7 | .1 Mfd. | 455 k.c. | "A" | No Signal 550-750 k.c. | 2nd I.F. Transformer | C11 & C12 |
| 2 | Control Grid 6SA7 | .1 Mfd. | 455 k.c. | "A" | 550-750 k.c. | 1st I.F. Transformer | C8 & C9 |
| 3 | Ant. Terminal | 300 Ohms | 1,500 k.c. | "A" | 1,500 k.c. 22° | "A" Osc. | C25 |
| 4 | Radiated signal * | — | 1,500 k.c. | "A" | 1,500 k.c. 22° | "A" Ant. | C1 |
| 5 | Ant. Terminal | 300 Ohms | 15,200 k.c. | 19 M | 15,200 k.c. 93° | 19 M Osc. | L11 |
| 6 | Ant. Terminal | 300 Ohms | 11,800 k.c. | 25 M | 11,800 k.c. 82° | 25 M Osc. | L12 |
| 7 | Ant. Terminal | 300 Ohms | 9,550 k.c. | 31 M | 9,550 k.c. 104° | 31 M Osc. | L13 |
| 8 | Ant. Terminal | 300 Ohms | 9,550 k.c. | 31 M | 9,550 k.c. 104° | 31 M Ant. | C4 |

All adjustments indicated above except operation 4, are made with antenna link in the open position.

*Radiation loop comprising two turns of wire 18 inches in diameter should be connected to test oscillator and placed approximately 4 feet from receiver before adjusting C1.
